DIRECTIONS:

1. READ THROUGH THE ‘HEAT TRANSFER’ READING PASSAGE ON PAGE 1.

2. COMPLETE THE QUESTIONS #1-16 ON PAGE 2 BY REFERRING BACK TO THE READING COMPONENT.

*THIS ASSIGNMENT WILL BE WORTH 23 POINTS*
Heat Transfer

Key Concepts:
- How is temperature measured?
- How is heat transferred into the troposphere?

All substances are made up of small particles, which can be atoms or molecules, that are constantly moving. The faster the molecules are moving, the more energy they have. The total energy of motion in the particles of a substance is called thermal energy. Temperature is the average amount of energy of motion in each particle of a substance. It is a measure of how or cold a substance is. Temperature is one of the most important elements of weather.

Air temperature is usually measured with a thermometer. A thermometer is a thin glass tube with a bulb on one end that contains a liquid, usually mercury or colored alcohol. Thermometers work because liquids expand when they are heated and contract when they are cooled.

Temperature is measured in units called degrees. On the Celsius scale, the freezing point of pure water is 0 degrees Celsius and the boiling point of water is 100 degrees Celsius. On the Fahrenheit scale, the freezing point of water is 32 degrees Fahrenheit and the boiling point is 212 degrees Fahrenheit.

Heat refers to the energy transferred from a hotter object to a cooler one. Heat is transferred in three ways: radiation, conduction, and convection.

Radiation is the transfer of energy by electromagnetic waves. The direct transfer of heat from one substance to another substance that is touching is called conduction. Conduction works well in some solids, but not as well in fluids (liquids and gases). In convection, heat is transferred by the movement of currents within a fluid. In fluids, molecules can move from place to place and take their heat with them.

Radiation, conduction, and convection work together to heat the troposphere. Air near Earth’s surface is warmed by conduction of heat from the surface to the air. Within the troposphere, heat is transferred mostly by convection. When the air near the ground is heated, the molecules have more energy and move faster. The molecules bump into one another and move farther apart, or become less dense. Cooler, denser air sinks, forcing the warmer, less dense air to rise. The upward movement of warm air and the downward movement of cool air from convection currents move heat throughout the troposphere.
Heat Transfer

Understanding Main Ideas

Label each picture with the type of heat transfer that it shows.

1. __________________  2. __________________  3. __________________  4. __________________

Answer the following questions in the spaces provided.

5. How is air temperature usually measured? ________________________________

6. At what temperature on the Celsius scale does pure water freeze? At what temperature does it boil? ________________________________

7. Name the three ways by which heat is transferred. ________________________________

8. How is heat transferred from the sun to Earth? ________________________________

9. Heat is moved through the troposphere mainly by ________________________________

Building Vocabulary

Fill in the blank to complete each statement.

10. The total energy of motion in the particles of a substance is called ________________________________.

11. ________________________________ is the average amount of energy of motion in the particles of a substance.

12. A(n) ________________________________ is a thin glass tube with a bulb on the end that contains a liquid, usually mercury or colored alcohol.

13. The energy transferred from a hotter object to a cooler one is referred to as ________________________________.

14. The direct transfer of heat from one substance to another substance that it is touching is called ________________________________.

15. The transfer of heat by the movement of a liquid is called ________________________________

16. Draw your own example of each of three types of heat transfer in the boxes below and describe why it demonstrates that type of heat transfer.

Conduction

Radiation

Convection
